 Concluding Remarks

Background

- MIMO systems' promise wonderland of diversity and/or multiplexing gains
 - requires multiple RF chains, which may lead to a high power consumption and hardware costs
- Antenna Selection (AS):
 - Offers a low-cost technique of reducing the number of RF chains utilised at the transmitter and/or receiver, while retaining the significant advantages of MIMO systems
- Challenges:
 - Low-complexity AS is always desirable
 - Efficient channel estimation (CE) is needed

Our Contributions

- Existing joint transmit/receive AS and CE schemes
 - Full-search based AS achieves optimal performance, while imposing a high complexity
 - Sub-optimal AS leads to a certain performance loss
 - Conventional training based CE (TBCE) imposes a high overhead required for acquiring accurate CSI, while pure blilnd CE imposes a high complexity and estimation ambiguities
- Our novel NBJTRAS and TTCE
 - The new NBJTRAS relies on norm-based antenna selection optimization at a much lower complexity
 - Simple yet efficient TTCE is capable of acquiring accurate CSI, while imposing a low overhead.

Conclusions

Norm-Based Selection (NBS) Criterion

Let *H*_{sub} ∈ C^{L_R×L_T} be the subset candidates of the full channel matrix *H* ∈ C^{N_R×N_T}, while the corresponding selected subset *H*_{sub} based on the NBS criterion may be formulated as:

$$\boldsymbol{H}_{sub} = \arg \max_{\widehat{\boldsymbol{H}}_{sub} \in \boldsymbol{H}} \left\{ \sum_{n_t=1}^{L_T} \sum_{n_r=1}^{L_R} || \widehat{\boldsymbol{H}}_{sub}(n_r, n_t) || \right\}$$
(1)

• Solving the above optimization problem by exhaustive search requires us to evaluate the norms of the $C_{N_R}^{L_R} \times C_{N_T}^{L_T}$ candidate subset matrices, where $C_{N_R}^{L_R}$ and $C_{N_T}^{L_T}$ are the row-dimension and column-dimension combinations of H_{sub} , respectively.

Conclusions

NBJTRAS Algorithm Description

- Given the full channel matrix *H* ∈ C<sup>N_R×N₇, without loss of generality, assume C^{L_R}_{N_R} < C^{L₇}_{N₇}. The NBJTRAS algorithm accomplishes the optimization in two Steps:
 </sup>
- Step 1: Row Based Operations

Let $i_r \in \{1, 2, \cdots, C_{N_R}^{L_R}\}$ be the row combination index, and get the sub-matrix $\boldsymbol{H}_{i_r} \in \mathbb{C}^{L_R \times N_T}$. Compute the magnitude of each column in \boldsymbol{H}_{i_r} , which yields the norm metric vector of

$$\boldsymbol{m}_{i_r}^{\mathrm{T}} = \left[m_{i_r}^{1} \ m_{i_r}^{2} \cdots m_{i_r}^{N_T} \right].$$
⁽²⁾

- ロ ト 4 日 ト 4 日 ト 4 日 ト 4 日 ト

Applying (2) to all the $C_{N_R}^{L_R}$ possible combinations leads to the norm metric matrix $\boldsymbol{M}^{\mathrm{T}} = [\boldsymbol{m}_1, \boldsymbol{m}_2, \cdots, \boldsymbol{m}_{C_{N_R}^{L_R}}] \in \mathbb{C}^{N_T \times C_{N_R}^{L_R}}$.

Conclusions

NBJTRAS Algorithm Description

Step 2: Column Based Operations

Find the largest L_T elements in the *i*_{*r*}th row of **M** and sum them up, which is denoted as $m_{\max}^{i_r}$, as well as record the column indices of these L_T elements in the index vector, producing the max-norm metric vector of

$$\boldsymbol{m}_{\max}^{\mathrm{T}} = \left[m_{\max}^{1} \ m_{\max}^{2} \cdots m_{\max}^{\mathsf{C}_{N_{R}}^{L_{R}}} \right]. \tag{3}$$

(日) (日) (日) (日) (日) (日) (日) (日)

Then the optimal sub-set may be found by identifying the largest element in (3).

Conclusions

Complexity Comparison

• Complexity of the Exhaustive Search:

$$\boldsymbol{C}_{\mathrm{ES}} \approx \mathcal{O}\left(\left(\boldsymbol{L}_{R} \cdot \boldsymbol{L}_{T}\right) \cdot \left(\boldsymbol{C}_{\boldsymbol{N}_{T}}^{\boldsymbol{L}_{T}} \cdot \boldsymbol{C}_{\boldsymbol{N}_{R}}^{\boldsymbol{L}_{R}}\right)\right)$$

• Complexity of the **NBJTRAS**:

$$\begin{split} C_{\text{NBJTRAS}} &\approx \mathcal{O}\left(\left(N_{T} \cdot L_{R}\right) \cdot \frac{\mathsf{C}_{N_{R}}^{L_{R}}}{\mathsf{N}_{R}}\right) \text{ (if } \mathsf{C}_{N_{R}}^{L_{R}} \leq \mathsf{C}_{N_{T}}^{L_{T}} \text{)} \\ \text{or } C_{\text{NBJTRAS}} &\approx \mathcal{O}\left(\left(N_{R} \cdot L_{T}\right) \cdot \frac{\mathsf{C}_{N_{T}}^{L_{T}}}{\mathsf{N}_{T}}\right) \text{ (if } \mathsf{C}_{N_{R}}^{L_{R}} > \mathsf{C}_{N_{T}}^{L_{T}} \text{)} \end{split}$$

Structure of Two-Tier Channel Estimation for NBJTRAS

Conclusions

Two-Tier Channel Estimation for NBJTRAS

• Tier One: Training Based CE (TBCE) for AS

- We adopt the low-complexity TBCE relying on a low training overhead in Tier One to maintain a high throughput at the cost of a poor CE
- AS is relatively **insensitive** to CE errors, therefore this inaccurate CE is adequate for the NBJTRAS scheme
- The RF chains are **reused** during the estimation of the full channel matrix.
- Tier Two: Decision-Directed CE (DDCE) for data detection
 - Data detection requires accurate CE
 - Semi-blind DDCE employs detected data for further refining CE quality

- 3 Simulation Example
 - Simulation Settings
 - Simulation Results
- Conclusions
 Concluding Remarks

Simulation Settings

- Quasi-static Rayleigh fading MIMO: STSK($L_T = 2, L_R = 2, T_n = 2, Q = 4, 4QAM$)
- 2 AS factor is defined as $f_{AS}(N_T, N_R) = \frac{N_T + N_R}{L_T + L_R}$
- Similar Transmitted signal power normalised to unity, SNR defined as $\frac{1}{N_0}$
- Sector Frame length set to 1,000 bits, yielding $\tau = 250$ STSK symbol blocks
- Solution Mean Channel Error (MCE): $J_{\text{MCE}}\left(\widehat{\boldsymbol{H}}_{\text{sub}}\right) = \left\|\boldsymbol{H}_{\text{sub}} - \widehat{\boldsymbol{H}}_{\text{sub}}\right\|^{2} / \left\|\boldsymbol{H}_{\text{sub}}\right\|^{2}$
- All the results were averaged over 10,000 channel realisations

Summary

- We have proposed a simple yet efficient NBJTRAS aided STSK system
 - Provides a low-complexity technique of reducing the number of RF chains required by MIMO systems, while retaining the MIMO advantages
 - Our NBJTRAS is capable of solving the optimal NBS criterion at a lower complexity compared to the exhaustive search
- We have proposed a novel TTCE scheme for assisting the NBJTRAS aided STSK system
 - Only requires a low training overhead in Tier One for AS
 - Estimation of the selected sub-channel-matrix is further refined in Tier Two for data detection
